CLEAR

Launch guide

Guide 2 of 3 · Build and publish

From Claude to the Play Store.

Every step from the project zip to a live app, in order, with what to click and what to paste.

Clear Audio Recorder · version 1.0 · 10 November 2026 · prepared for Daxator

00

Where you are now

Built
app, admin panel, guides, store graphics

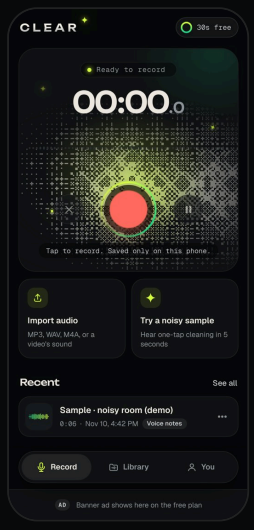

Tested
in a browser and by automated checks, not yet on a real phone

Yours to do
accounts, keys, store forms, 14-day test

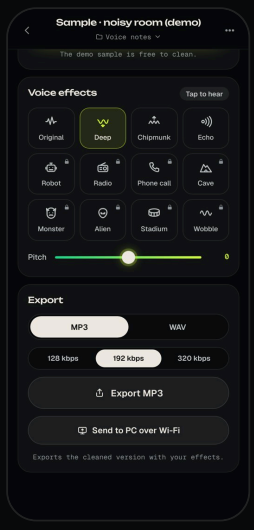

This is how the app was made: you described it to Claude, Claude wrote the code and tested it, and packed everything into one project zip. GitHub turns that zip into an installable app, so you never open a code editor. The screenshots below are the real app.

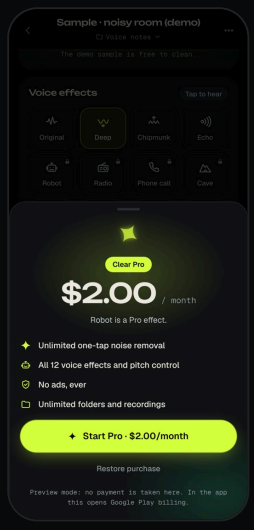

Splash

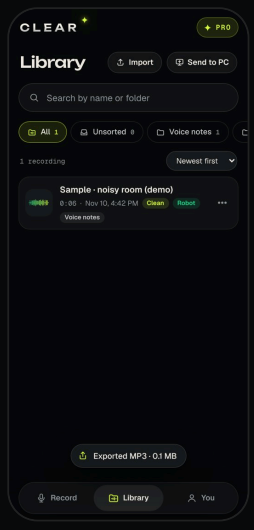

Record

Voice effects and export

Pro screen

Library and folders

01

Put the project on GitHub and get the app file

1. On **github.com** create a new **private** repository called `clear-audio-recorder`. Leave it empty.
   `github.com → New repository`

2. Send Claude the repository link and say "push the project". Claude uploads all the files. (Uploading by hand through the website is limited to 100 files at a time, and the project has slightly more.)

3. Open the **Actions** tab. A job called **Build Android app** starts on its own and takes about 10 minutes.
   `Repository → Actions`

4. When it turns green, open it, scroll to **Artifacts** and download **clear-audio-recorder-test-apk**. Unzip it, send the .apk to your phone, tap it and allow "Install unknown apps".

This first build is the real test

The Android part could not be compiled inside Claude's workspace, so GitHub's build is the first full compile. If the job turns red, copy the red error text to Claude and it will be fixed. Expect one or two rounds of this.

02

Test on your phone

- [ ] Record, pause, resume, save. Try the volume-button option (You → Recording).
- [ ] Clean a noisy recording. Compare Before and After on Light, Medium and Strong.
- [ ] Try effects and the pitch slider. Locked effects should open the Pro screen.
- [ ] Make folders, move, rename, search, delete.
- [ ] Export MP3 and WAV through the share menu.
- [ ] Send to PC: open the address on a laptop on the same Wi-Fi and download.
- [ ] Ads show as "Test Ad".
- [ ] Uninstall and reinstall: recordings must be gone.

03

Open your accounts

Account	Cost	Notes
Google Play Console	$25 once	Identity check takes a few days. Pakistan is supported for selling and for wire payouts.
Firebase	Free	Sign-in, user list, admin panel data. Set up in Guide 1, section 03.
RevenueCat	Free to $2,500/mo	Then 1% of tracked revenue.
AdMob	Free	Pays ad earnings.
Cloudflare or Netlify	Free	Hosts the admin panel and your privacy policy page.

04

Create your signing key

1. In Actions, choose **Make Play Store upload key (run once)** → Run workflow.
   `Repository → Actions`
2. Download the artifact within 24 hours. Open **SECRETS-TO-ADD.txt** and add the four secrets it lists.
   `Repository → Settings → Secrets and variables → Actions → New repository secret`
3. The same text file contains your **SHA-1** fingerprint. Paste it into Firebase (Guide 1, step 7).
4. Save `upload-key.jks` and the passwords in two safe places, then delete the artifact.

From now on every build also produces **clear-audio-recorder-signed-apk** (use this to test Google sign-in) and **clear-audio-recorder-play-store-aab** (the file you upload to Play).

05

Paste your keys

Everything goes in one file, `src/native/config.js`. You can edit it on github.com with the pencil icon; saving starts a new build.

Line	Where the value comes from
firebase: apiKey, authDomain, projectId, appId	Firebase → Project settings → Your apps → Web app
googleWebClientId	Firebase → Authentication → Sign-in method → Google
revenueCatAndroidKey	RevenueCat → Project → API keys (starts with `goog_`)
admob.banner, admob.interstitial, adsTestMode: false	AdMob → Apps → Ad units

One more: in `android/app/src/main/AndroidManifest.xml`, replace the test AdMob **App ID** with yours.

06

The $2 subscription

1. Create the app in Play Console and upload your first .aab to Internal testing. Play only lets you create subscriptions after one upload.
   `Play Console → Testing → Internal testing`
2. Create a subscription with product ID `clear_pro_monthly`, one monthly auto-renewing base plan at **US$1.99** or $2.00.
   `Monetize → Products → Subscriptions`

3. In RevenueCat add an Android app with your package name, connect Play (follow their Google Play guide), and import the product.
   `app.revenuecat.com`
4. Create an entitlement named exactly `pro`, attach the product, and make an offering **default** with a **Monthly** package.
5. Add your Gmail as a license tester so your own test purchases are free.
   `Play Console → Settings → License testing`

07

Ads

1. Add the app in AdMob and create two ad units: **Banner** and **Interstitial**.
   `admob.google.com → Apps`
2. Publish the European consent message. The app already shows it where required.
   `Privacy & messaging → European regulations`
3. Put the `app-ads.txt` line AdMob gives you on the same website as your privacy policy.
4. Never tap your own live ads. AdMob closes accounts for that.

08

Store listing and forms

Use the graphics in the project's `store` folder: the 512×512 icon and the 1024×500 feature graphic. Take 4 to 8 phone screenshots from the installed app. Upload `store/privacy-policy.html` to your free host and fill in the two bracketed lines.

Field	Paste this
App name	Clear Audio Recorder
Short description	Record and remove background noise in one tap. Voice effects, folders, MP3/WAV.
Category	Music & Audio
Ads	Yes, contains ads
App access	All features available without login (sign-in is optional)
Target audience	18 and over
Account deletion	In-app: You → Delete account. Web link: your privacy policy page, "Deleting your data" section.

Data safety form

Data	Collected	Why
Audio recordings	No	Stay on the device
Name, email address, user ID	Yes, optional	Account management (Google sign-in)
App interactions	Yes	Analytics (usage counts tied to the account)
Purchase history	Yes	To know who has Pro (Google Play, RevenueCat)
Device or other IDs, approximate location, diagnostics	Yes, shared	Advertising (AdMob)

Answer "Yes" to data encrypted in transit and "Yes" to users can request deletion.

09

Closed test, then go live

1. New personal developer accounts must run a **closed test with at least 12 testers opted in for 14 days in a row** before applying for production.

   `Play Console → Testing → Closed testing`

2. Invite friends, family, your team and students. Ask each to record, clean and export once. Gift them Pro from the admin panel so they test everything.

3. Fix what they report (send it to Claude), then apply for production access. Review usually takes a few days.

   `Play Console → Dashboard`

10

iPhone and the App Store

Not included yet

Version 1.0 is Android only. An iPhone version reuses the same screens and audio engine, but three parts must be rebuilt for iOS (volume-button control, Send to PC, subscriptions through Apple), and the app file can only be produced on a Mac or a paid cloud Mac service with an Apple Developer account ($99 a year). Launch on Android first, prove people pay, then ask Claude for the iOS pass.
